

What methods of Data Access does Exaquantum/Batch supported?

Exaquantum/Batch data is stored in a standard normalised SQL Server Database. It is therefore possible to access data using functionality built in to Windows and/or Application Development Environments like Visual Studio. There is therefore no custom API provided. Any third party application can use ODBC or ADO techniques to access Exaquantum/Batch data directly. The database views are all documented in the online help system (Navigate to Reports→Report Data).
