

## **Can I use earlier versions of the client software with servers running new releases of Exaquantum?**

It is possible to use older client versions with newer server versions in most cases as long as the clients are at least at R1.10. If you wish to use clients that are significantly older than the server version you are advised to check with your local affiliate about any restrictions that you are likely to encounter.

We do not consider the mixing of releases to be an optimum solution. We prefer to have all clients running the same Exaquantum version as the server. However, it is normal practice to upgrade a server to the latest version and then upgrade the clients over time until they are all at the same release. You should note that function of the client is fixed at that version and older clients cannot take advantage of new features in a more recent revision.
